Long-Term Concrete Patching/Repair

Ceratech's new Pavemend SLQ is an extremely rapid-hardening, high-early-strength material for patching and long-term repair of concrete and structural asphalt surfaces. The material offers extremely aggressive bonding characteristics along with one-hour compressive strengths exceeding 3,400 psi, enabling repairs to be reloaded by wheeled vehicles in just one hour, and foot traffic in only 20 minutes. Pavemend SLQ has four to six minutes of working time, can be applied in ambient temperatures from 1 to 90 degrees F, is self-priming, self-curing, extendable, and semi-leveling. Applications include the repair of roads and bridges, airport runways and tarmacs, post-tension cable repairs, and more.
