Fast Patching: Quick Turnaround

Developed for patching and long-term repair of concrete, masonry and structural asphalt, PAVEMEND SLQ is intended for urgent infrastructure repair. With one hour compressive strengths of 3,400 psi, mended areas are ready to receive loads from wheeled traffic in one hour and pedestrian loads in twenty minutes. The single component powder requires only water for activation. It will bond to most construction surfaces including steel, and is self-adhering, with no need for cold joints.
