Concrete repair alternative offers vehicle re-load in one hour

As part of the non-Portland, non-epoxy, all-weather Pavemend repair line, Ceratech's Pavemend SLQ rapidly hardens and provides patching for long-term repair of concrete, masonry and structural asphalt surfaces. Pavemend SLQ offers aggressive bonding and one-hour compressive strengths exceeding 3,400 psi, enabling infrastructure repairs to withstand the weight of vehicles in one hour and pedestrian traffic within 20 minutes. The water-activated, single component powder becomes a slurry mix that bonds to most construction materials, including steel, in four to six minutes. Pavemend SLQ also bonds to itself with no surface preparation, allowing indefinite layering without cold joints.
