January 21, 2010

Gentlemen,

I thought I would take a moment to comment on the Pavemend 15.0 that we had the privilege of using on one of our projects last year (2009). We had a bridge repair project that was started late in the construction season. It consisted of joint repair, pier repair, sidewalk repair and other structural repairs. The cold weather set in a little earlier than we expected, and was unusually cold for Kentucky. We had been using M.G. Crete to do some of the repairs and were having bonding issues with the material. I can only attribute this to the colder weather because I have used the material in the past without much issue. However, in this circumstance, we decided to try the Pavemend 15.0 to see if we could get better results.

The material far exceeded my expectations. The bond was perfect, the material mixed flawlessly, kept a nice wet edge to ensure consistency during the pouring process, and matched the existing material perfectly. The result was amazing, one could hardly tell where we patched the piers. The project was in liquidated damages and I was under a lot of pressure to finish the project to stop the damages. The product saved me a lot of money and made the work a lot easier for my employees. I appreciate your efforts on developing such a great product.

Sincerely

Jeffrey J McMahon, President
